"Some Clinical Aspects of Thrombosis of Central Retinal Vein."

Belgrade, Medicinski Glasnik, Vol 16, No 10-12, Oct-Dec 1962; pp 437-437.

Abstract: Data on 55 patients seen in 10 years. Main differences with
classical concepts are the relatively young average age (of the 45 for
which full data are available, 9 were below 40, another 9 between 40
and 50 years old; a third had normal blood pressure. Most came quite
late during the course of progressive vision loss, so that treatment
(anticoagulants, vitamins, Ca, vasodilators, antibiotics) had little
chance of true success. Secondary glaucoma appeared in 5. Four tables,
7 Western and 2 Yugoslav references.

"Heritability of Congenital Glaucoma."

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 91, No 3, Mar 63;
pp 259-268.

Abstract[French summary modified]: Clinical - genetic study of congenital glaucoma in 6 families: apparent autosomal recessive, sex-controlled transmission; magalocornea in 8 individuals of 3 generations in 1 family looks dominant in relation to glaucoma; relationship between the conditions is not clarified. Definitely confirmed hereditary glaucoma forms 6.5% of author's cases; carrier characteristics are unfortunately as yet elusive but eugenic measures are advocated - ban consanguineous marriages, study somatic signs of heterozygosity. Six family trees; 24 Western references.

"The Role of Exenteration of the Orbit Today"

Belgrade, Grpski arhiv za celokupno lekarstvo, Vol 93, No 9, Sep 65, pages 781-790.

Abstract [Authors' English summary modified]: The authors analyze the indications, operative techniques and results in exenteration of the orbit carried out in 83 patients over a ten-years period (1955-64). Basic indications of the disease were connected with different malignant processes whose evolution did not permit other operative and therapeutical procedures. Most of the patients had had this tumor for over a year and many of them more than ten years. Visual acuteness was limited to amaurosis or light projection. Increased sedimentation was noted in 50% of the cases. The reaction of the urine to melanin and melanogen was negative. More than 50% survived the operation up to 2 years, 12 up to 5 years, and only 6 survived over six years. The radical exenteration with the removal of eye-lids should always be carried out. In most cases blood transfusion and X-ray treatment are ne-

"The Question of Heredity in Primary Glaucoma"

Belgrade, Medicinski Glasnik, Vol 20, No 5-6, May-June 1966, p. 186-188

Abstract [French summary modified]: Among 94 cases of glaucoma, a familial history was present in 29% of the 31 men but only in 6.3% of the 63 women. A case of glaucoma in six generations is described in great detail. Author suggests that the X chromosome carries the gene, based on these data and on various literature reports. Family tree; 3 Yugoslav, 22 Western references.

TITLE: Determination of silicon in O-(Trimethylsilyl)-derivatives of saccharides

SOURCE: Chemicke zvesti, no. 9, 1964, 688-691

TOPIC TAGS: silicon, analytic chemistry, hydrolysis, organic silicon compound, carbohydrate

Abstract [Authors' German summary, modified]: Described is a method of determining silicon in some derivatives of O-(trimethylsilyl)saccharides, O-(trimethylsilyl)polysaccharides, N-(trimethylsilyl)-amines, and trimethylsilyl esters of organic acids. The method is based on a hydrolytic decomposition of substances. Hydrolysis products (trimethylsilanol and hexamethylsiloxane) are brought by an oxygen flow to a combustion tube where they are quantitatively burned to silicon dioxide.

TITLE: Effect of chlorination process upon aminoacids and proteins (II). Active
chlorine in egg albumin chlorinated under various conditions

SOURCE: Chemicke zvesti, no. 12, 1965, 936-941

TOPIC TAGS: chlorination, amino acid, chlorine, protein, nitrogen

ABSTRACT: The amount of combined active chlorine in egg albumin varying according to
the pH during chlorination, the reaction time, and ratio of the chlorination agent to
albumin was studied. The amount of nitrogen liberated during the chlorination is
described and evaluated. Mole ratios of the combined active chlorine to nitrogen are
discussed. Orig. art. has: 2 tables. [JPRS]

"Laboratory Tests of the Possibility of Using Lead Compounds as a Rat-icide Through the Reduction of the Reproductive Capacity of Rats."

Belgrade, Acta Veterinaria, Vol 13, No 1, 1963, pp 3-9.

Abstract: Authors' English summary modified Eight groups of 40 rats each were given various doses of lead nitrates (80 to 8000 milligrams per 100 grams of various kinds of food) for 30 days, with a ninth group as a control group. Three male rats were killed and examined every other day. The lead deposited in the testes of the rats proved to be not entirely proportional to the amount included in the food, viz., 0.0021 milligrams to 0.0188 milligrams as against 0.0013 milligrams in the control group. No pathoanatomical changes were found in any of the organs of the rats. Pathohistological changes occurred only with an intake of 800 or more milligrams of $Pb(NO_3)_2$ per 100 grams of food. No reproduction occurred within 45 days when males thus given lead nitrates were paired with females (whether treated with lead nitrates or not). Three tables, four illustrations, nine references (five Yugoslav, four Western).

"Initial Impressions of the Diagnostic Use of Radioactive Phosphorus in Ophthalmology."

Belgrade, Sposki Arhiv za Celokupno Lekarstvo, Vol. 90, No 11, December 1962, pp 1197-1202.

Abstract: [Authors' French summary modified] In 10 cases observed at the Clinic for Eye Diseases, the use of radioactive phosphorus established four cases of malignant growths on the retina which were histologically confirmed but gave falsely positive results in two cases immediately after surgical intervention and was negative in the other four cases. The method appears justified in diagnosing intracocular tumors if regarded as an auxiliary method and not at the decisive factor. One table, 12 references to [1] US and British works (mainly recent).

subconjunctival injections of (cadaver) vitreous humor and report about 20
patients treated 1960-61; 10 to 12 injections of 0.3 to 0.5 cc. each (every
few days): little objective corneal change but pronounced improvement in
decrease of photophobia, blepharospasm, lacrymation. Corneal surface
lesions did epithelialize in 5 of the patients; however, any effects are
considered merely placebo response. One Soviet and 3 Western references.

"Influence of Bismuth Therapy on the Acidity and Pepsin of Ulcer Patients"
Belgrade, Medicinski Glasnik, Vol 19, No 11-12, Nov-Dec 1965, pp 316-318

Abstract: Bismuth-subnitrate causes subjective improvement of difficulties in 85,5% of cases. The value of acidity after therapy decreases in 2/3 of the patients and pepsin in one-half of them. This difference is the result of the weaker effect of bismuth therapy on pepsin, on the creation of proteolysis. With regard to the eventual effect of bismuth-subnitrate, the administration of the bismuth-subcarbonicum should be decided upon and therapy should be extended. Effect of bismuth treatment on anacid ulcers is shown more in the absence of the irritation factor of food than in connection with pepsin. No references.

Determination of essential oils in coniferous-tree needles.
Sirisa Stanković and Radomir Senić. *Glavnik Šumarskog
Fak., Univ. Beogradu* No. 5, 271-81 (1952) (English sum-
mary).—The needles were boiled in water, and the mixt. was
distd. The distillate was extd. with petr. ether, and the n
of exts. was detd.. The n vs. vol. % plot gives a slightly
upward convex curve which cannot be used as standard
curve for oil detn. because of variation in chem. compn. of
oils, which in its turn is dependent on the variety of trees as
well as on ecological factors. Two parallel distns. are pro-
posed, one for quant. detn. and the other for the detn. of n
of pure oil of each particular pattern. The n of solvent
(a), on pure oil (b), and of petr. ether ext. of oil (d) are related
as $x = (d - a)/(b - a) \times 100$, where x gives the vol. percent
of oil in petr. ether ext. The x value contains an error by
assuming that the n values are in linear proportion to the
concn. This was corrected by using concns. of less than 10
vol. %, where the curve is identical with the theoretical
 n -concn. relation. The errors were reduced to 0.002%,
calcd. on the basis of wt. of needles. Therefore the whole
formula is: $c = [(d - a)/(b - a) \times 100] - [(d - a)/(b - a) \times 11]$.
V. Mihajlov
